

Motion

If an object changes its position with respect to its surroundings with time, then it is called in motion.

Rest

If an object does not change its position with respect to its surroundings with time, then it is called at rest.

[Rest and motion are relative states. It means an object which is at rest in one frame of reference can be in motion in another frame of reference at the same time.]

Point Mass Object An object can be considered as a point mass object, if the distance travelled by it in motion is very large in comparison to its dimensions.

Types of Motion

1. One Dimensional Motion

If only one out of three coordinates specifying the position of the object changes with respect to time, then the motion is called one dimensional motion.

For instance, motion of a block in a straight line motion of a train along a straight track a man walking on a level and narrow road and object falling under gravity etc.

2. Two Dimensional Motion

If only two out of three coordinates specifying the position of the object changes with respect to time, then the motion is called two dimensional motion.

A circular motion is an instance of two dimensional motion.

3. Three Dimensional Motion

If all the three coordinates specifying the position of the object changes with respect to time, then the motion is called three dimensional motion.

A few instances of three dimension are flying bird, a flying kite, a flying aeroplane, the random motion of gas molecule etc.

Distance

The length of the actual path traversed by an object is called the distance.

It is a scalar quantity and it can never be zero or negative during the motion of an object. Its unit is metre.

Displacement

The shortest distance between the initial and final positions of any object during motion is called displacement. The displacement of an object in a given time can be positive, zero or negative.

It is a vector quantity. Its unit is metre.

Speed

The time rate of change of position of the object in any direction is called speed of the object. Speed (v) = Distance travelled (s) / Time taken (t)

Its unit is m/s.

It is a scalar quantity.

Its dimensional formula is $[M^0T^{-1}]$.

Uniform Speed

If an object covers equal distances in equal intervals of time, then its speed is called uniform speed.

Non-uniform or Variable Speed

If an object covers unequal distances in equal intervals of time, then its speed is called non-uniform or variable speed.

Average Speed

The ratio of the total distance travelled by the object to the total time taken is called average speed of the object.

Average speed = Total distanced travelled / Total time taken

If a particle travels distances s_1, s_2, s_3, \dots with speeds v_1, v_2, v_3, \dots , then Average

$$\text{speed} = \frac{s_1 + s_2 + s_3 + \dots}{(s_1 / v_1 + s_2 / v_2 + s_3 / v_3 + \dots)}$$

If particle travels equal distances ($s_1 = s_2 = s$) with velocities v_1 and v_2 , then

$$\text{Average speed} = \frac{2 v_1 v_2}{(v_1 + v_2)}$$

If a particle travels with speeds v_1, v_2, v_3, \dots , during time intervals t_1, t_2, t_3, \dots , then

$$\text{Average speed} = \frac{v_1 t_1 + v_2 t_2 + v_3 t_3 + \dots}{t_1 + t_2 + t_3 + \dots}$$

If particle travels with speeds v_1 , and v_2 for equal time intervals, i.e., $t_1 = t_2 = t_3$, then

$$\text{Average speed} = \frac{v_1 + v_2}{2}$$

When a body travels equal distance with speeds V_1 and V_2 , the average speed (v) is the harmonic mean of two speeds.

$$\frac{2}{v} = \frac{1}{v_1} + \frac{1}{v_2}$$

Instantaneous Speed

When an object is travelling with variable speed, then its speed at a given instant of time is called its instantaneous speed.

Instantaneous speed = $\lim_{\Delta t \rightarrow 0} \frac{\Delta s}{\Delta t} = \frac{ds}{dt}$

Velocity

The rate of change of displacement of an object in a particular direction is called its velocity. Velocity = Displacement / Time taken

Its unit is m/s.

Its dimensional formula is $[M^0T^{-1}]$.

It is a vector quantity, as it has both, the magnitude and direction. The velocity of an object can be positive, zero and negative.

Uniform Velocity

If an object undergoes equal displacements in equal intervals of time, then it is said to be moving with a uniform velocity.

Non-uniform or Variable Velocity

If an object undergoes unequal displacements in equal intervals of time, then it is said to be moving with a non-uniform or variable velocity.

Relative Velocity

Relative velocity of one object with respect to another object is the time rate of change of relative position of one object with respect to another object.

Relative velocity of object A with respect to object B

$$V_{AB} = V_A - V_B$$

When two objects are moving in the same direction, then

or

$$\begin{aligned} V_{AB} &= V_A - V_B \\ V_{AB} &= V_A - V_B \end{aligned}$$

When two objects are moving in opposite direction, then

or

$$\begin{aligned} V_{AB} &= V_A + V_B \\ V_{AB} &= V_A + V_B \end{aligned}$$

When two objects are moving at an angle, then

and $\tan \beta = v_B \sin \theta / v_A - v_B \cos \theta$

Average Velocity

The ratio of the total displacement to the total time taken is called average velocity. Average velocity = Total displacement / Total time taken

Acceleration

The time rate of change of velocity is called acceleration.

Acceleration (a) = Change in velocity (Δv) / Time interval (Δt)

Its unit is m/s^2

Its dimensional formula is $[M^0 L T^{-2}]$.

It is a vector quantity.

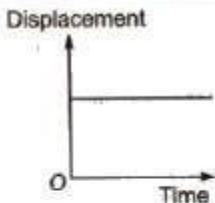

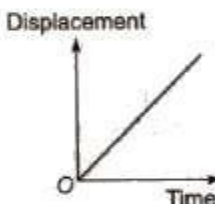

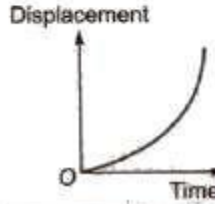

Acceleration can be positive, zero or negative. Positive acceleration means velocity increasing with time, zero acceleration means velocity is uniform while negative acceleration (retardation) means velocity is decreasing with time.

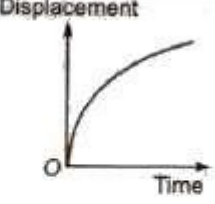

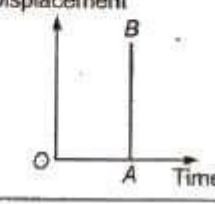

If a particle is accelerated for a time t_1 with acceleration a_1 and for a time t_2 with acceleration a_2 , then average acceleration

$$a_{av} = a_1 t_1 + a_2 t_2 / t_1 + t_2 .$$

Different Graphs of Motion

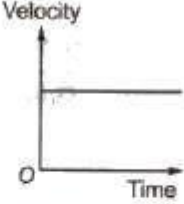

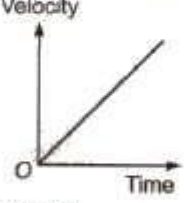

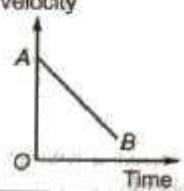

Displacement – Time Graph

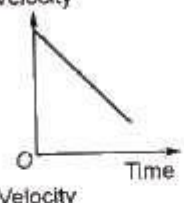

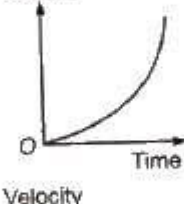

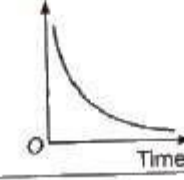

S. No.	Condition	Graph
(a)	For a stationary body	
(b)	Body moving with a constant velocity	
(c)	Body moving with a constant acceleration	

S. No.	Condition	Graph
(d)	Body moving with a constant retardation	
(e)	Body moving with infinite velocity. But such motion of a body is never possible.	

Note Slope of displacement-time graph gives average velocity.

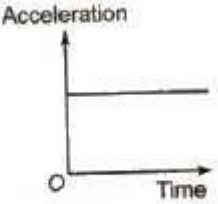

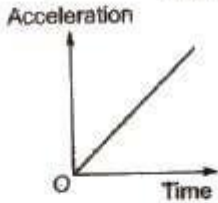

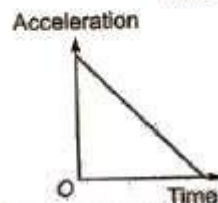

Velocity – Time Graph

S. No.	Condition	Graph
(a)	Moving with a constant velocity	
(b)	Moving with a constant acceleration	
(c)	Body moving with a constant retardation and its initial velocity is not zero.	

S. No.	Condition	Graph
(d)	Moving with a constant retardation	
(e)	Moving with increasing acceleration	
(f)	Moving with decreasing acceleration	

Note Slope of velocity-time graph gives average acceleration.

Acceleration – Time

S. No.	Condition	Graph
(a)	When object is moving with constant acceleration	
(b)	When object is moving with constant increasing acceleration	
(c)	When object is moving with constant decreasing acceleration	

Equations of Uniformly Accelerated Motion

If a body starts with velocity (u) and after time t its velocity changes to v , if the uniform acceleration is a and the distance travelled in time t is s , then the following relations are obtained, which are called equations of uniformly accelerated motion.

(i) $v = u + at$

(ii) $s = ut + at^2$

(iii) $v^2 = u^2 + 2as$

(iv) Distance travelled in n th second.

$$S_n = u + a / 2(2n - 1)$$

If a body moves with uniform acceleration and velocity changes from u to v in a time interval, then the velocity at the mid point of its path

$$\sqrt{u^2 + v^2} / 2$$

Motion Under Gravity

If an object is falling freely ($u = 0$) under gravity, then equations of motion

(i) $v = u + gt$

(ii) $h = ut + gt^2$

(iii) $V^2 = u^2 + 2gh$

Note If an object is thrown upward then g is replaced by $-g$ in above three equations.

It thus follows that

(i) Time taken to reach maximum

height $t_A = u / g = \sqrt{2h / g}$

(ii) Maximum height reached by the

body $h_{\max} = u^2 / 2g$

(iii) A ball is dropped from a building of height h and it reaches after t seconds on earth. From the same building if two ball are thrown (one upwards and other downwards) with the same velocity u and they reach the earth surface after t_1 and t_2 seconds respectively, then

$t = \sqrt{t_1 t_2}$

(iv) When a body is dropped freely from the top of the tower and another body is projected horizontally from the same point, both will reach the ground at the same time.
