Nuclei

- **Atomic Number:** The number of protons in the nucleus is called the atomic number. It is denoted by Z.
- **Mass number:** The total number of protons and neutrons present in a nucleus is called the mass number of the element. It is denoted by A.
- No. of Protons, Electrons, Nucleons and Neutrons in an Atom:
- 1. Number of protons in an atom = Z
- 2. Number of electrons in an atom = Z
- 3. Number of nucleons in an atom = A
- 4. Number of neutrons in an atom = N = A Z.
 - Nuclear Mass: The total mass of the protons and neutrons present in a nucleus is called the nuclear mass.
 - \bullet $\,$ Nuclide: A nuclide is a specific nucleus of an atom characterized by its atomic number Z and mass number A. It is represented as, $\,_Z X^A$

Where X = chemical symbol of the element, Z = atomic number and A = mass number

- Isotopes:
- 1. The atoms of an element which have the same atomic number but different mass number are called isotopes.
- 2. Isotopes have similar chemical properties but different physical properties.
 - **Isobars:** The atoms having the same mass number but different atomic number are called isobars.
 - **Isotones:** The nuclides having the same number of neutrons are called isotones.
 - **Isomers:** These are nuclei with same atomic number and same mass number but in different energy states.
 - Electron Volt: It is defined as the energy acquired by an electron when it is

accelerated through a potential difference of 1 volt and is denoted by eV.

• Atomic Mass Unit:

- 1. It is $\frac{1}{12}th$ of the actual mass of a carbon atom of isotope $_6C^{12}.$ It is denoted by amu or just by u.
- 2. 1 amu = $1.660565 \times 10^{-27} \ \mathrm{kg}$
- 3. The energy equivalence of 1 amu is 1 amu = 931 MeV

• Discovery of Neutrons:

- 1. Neutrons were discovered by Chadwick in 1932.
- 2. When beryllium nuclei are bombarded by alpha-particles, highly penetrating radiations are emitted, which consists of neutral particles, each having mass nearly that of a proton. These particles were called neutrons.

$${}_{2}^{4}He + {}_{4}^{9}Be \rightarrow {}_{0}^{1}n + {}_{1}^{12}C$$

3. A free neutron decays spontaneously, with a half- life of about 900 s, into a proton, electron and an antineutrino.

$$^1_0 n o ^1_1 H + ^0_{-1} e + \overset{-}{v}$$

- Size of the Nucleus:
- 1. It is found that a nucleus of mass number A has a radius

1.
$$R = R_o A^{1/3}$$

Where,
$$R_0 = 1.2 \times 10^{-15} m$$

- 2. This implies that the volume of the nucleus, which is proportional to ${\bf R}^3$ is proportional to ${\bf A}$.
 - ullet Density of the Nucleus: Density of nucleus is constant; independent of A, for all nuclei and density of nuclear matter is approximately $2.3~ imes10^{17}\,kgm^{-3}$

which is very large as compared to ordinary matter, say water which is $10^3\,\mathrm{kg}\;\mathrm{m}^{-3}$.

• Mass-Energy equivalence: Einstein proved that it is necessary to treat mass as

another form of energy. He gave the mass-energy equivalence relation as, $E = mc^2$ Where m is the mass and c is the velocity of light in vacuum.

• Mass Defect: The difference between the rest mass of a nucleus and the sum of the rest masses of its constituent nucleons is called its mass defect. It is given by-

$$\Delta m = [Zm_p + (A-Z)m_n] - m$$

- Binding Energy:
- 1. It may be defined as the energy required to break a nucleus into its constituent protons and neutrons and to separate them to such a large distance that they may not interact with each other.
- 2. It may also be defined as the surplus energy which the nucleus gives up by virtue of their attractions which they become bound together to form a nucleus.
- 3. The binding energy of a nucleus ${}_{Z}X^{A}\,$ is-

$$B.E. = [Zm_p + (A - Z)m_n - m]c^2$$

• **Binding Energy per Nucleon:** It is average energy required to extract one nucleon from the nucleus.

It is obtained by dividing the binding energy of a nucleus by its mass number.

$$\overset{-}{B}=rac{B.E}{A}=rac{[Zm_p+(A-Z)m_n-m]c^2}{A}$$

- Nuclear Forces:
- 1. These are the strong in attractive forces which hold protons and neutrons together in a tiny nucleus.
- 2. These are short range forces which operate over very short distance of about 2 3 fm of separation between any two nucleons.
- 3. The nuclear force does not depend on the charge of the nucleon.
 - **Nuclear Density:** The density of a nucleus is independent of the size of the nucleus and is given by-

$$\rho_v = \frac{\text{Nuclear mass}}{\text{Nuclear volume}}$$

$$= rac{m_v}{rac{4}{3}\pi R^2} = 2.9 ext{ x } 10^{17} ext{ kg m}^{-3}$$

• Radioactivity:

- 1. It is the phenomenon of spontaneous disintegration of the nucleus of an atom with the emission of one or more radiations like α -particles, β -particles or γ -rays.
- 2. The substances which spontaneously emit penetrating radiation are called radioactive substances.
 - Radioactivity Displacement Law: It states that-
- 1. When a radioactive nucleus emits an α -particle, atomic number decreases by 2 and mass number decreases by 4.
- 2. When a radioactive nucleus emits β -particle, its atomic number increases by 1 but mass number remains same.
- 3. The emission of a γ -particle does not change the mass number or the atomic number of the radioactive nucleus. The γ -particle emission by a radioactive nucleus lowers its energy state.
 - **Alpha Decay:** It is the process of emission of an α -particle from a radioactive nucleus. It may be represented as,

$${}_{Z}^{A}X \rightarrow {}_{Z-2}^{A-4}Y + {}_{2}^{4}He + Q$$

• **Beta Decay:** It is the process of emission of an electron from a radioactive nucleus. It may be represented as,

$${}^A_ZX
ightarrow {}^A_{Z+1}Y + {}^0_{-1}e + \overline{v}$$

• **Gamma Decay:** It is the process of emission of a γ -ray photon during the radioactive disintegration of a nucleus. It can be represented as,

$${}^A_Z X \to {}^A_Z X + \gamma \ ext{(Excited State)} o ext{(Ground State)}$$

• Radioactive Decay Law: It states that the number of nuclei disintegrated of undecayed radioactive nuclei present at that instant. It may be written as-

$$N(t) = N(0)e^{-\lambda t}$$

Where N(0) is the number of nuclei at t = 0 and is disintegration constant.

- **Decay or disintegration Constant:** It may be defined as the reciprocal or the time interval in which the number of active nuclei in a given radioactive sample reduces to 36.8% of its initial value.
- **Half-life:** The half-life of a radioactive substance is the time in which one-half of its nuclei will disintegrate. It is inversely proportional to the decay constant of the radioactive substance.

$$T_{1/2}=rac{0.693}{\lambda}$$

 Mean Life: The mean-life of a radioactive sample is defined as the ratio of the combined age of all the atoms and the total number of atoms in the given sample. It is given by,

$$au = rac{T_{1/2}}{0.693} = 1.44 T_{1/2}$$

• Rate of Decay or Activity of a Radioactive Sample: It is defined as the number of radioactive disintegrations taking place per second in a given sample. It is expressed as-

$$R(t) = \left\lceil \frac{dN}{dt} \right\rceil = \lambda N(t) = \lambda N(0) e^{-\lambda t}$$

- Curie:
- 1. It is the SI unit of decay.
- 2. One curie is the decay rate of 3.7 \times 10 10 disintegrations per second.
 - **Rutherford:** One Rutherford is the decay rate of 10⁶ disintegrations per second.
 - Natural Radioactivity: It is the phenomenon of the spontaneous emission of α , β and γ radiations from the nuclei of naturally occurring isotopes.
 - Artificial or Induced Radioactivity: It is the phenomenon of inducing radioactivity
 in certain stable nuclei by bombarding them by suitable high energy sub atomic
 particles.
 - Nuclear Reaction: It is a reaction which involves the change of stable nuclei of one

element into the nucleus of another element.

• **Nuclear Fission:** It is the process in which a heavy nucleus when excited gets split into two smaller nuclei of nearly comparable masses. For example-

$$^{235}_{92}U + ^1_0n
ightarrow ^{141}_{56}Ba + ^{92}_{36}Kr + 3^1_0n + Q$$

- **Nuclear Reactor:** It is a device in which a nuclear chain reaction is initiated, maintained and controlled.
- **Nuclear Fusion:** It is the process of fusion of two smaller nuclei into a heavier nucleus with the liberation of large amount of energy.
- Critical size and Critical Mass:
- 1. The size of the fissionable material for which reproduction factor is unity is called critical size and its mass is called critical mass of the material.
- 2. The chain reaction in this case remains steady or sustained.

• Moderator:

- 1. Any substance which is used to slow down fast moving neutrons to thermal energies is called a moderator.
- 2. The commonly used moderators are water, heavy water (D_2O) and graphite.
